

Autism Spectrum Disorder and Anxiety Clinical Research Study

Adolescents and young adults with an autism spectrum disorder (ASD) diagnosis may experience symptoms of anxiety in addition to their autism symptoms. If your child, or an adolescent/young adult you know, has ASD and suffers from anxiety, you may be interested in learning more about our clinical trial here at Phoenix Children's Hospital.

Qualified participants include:

- Children, adolescents, and young adults ages 10-25 years
 - Those diagnosed with ASD who currently experience anxiety symptoms
- Other eligibility criteria may apply*

Additional information:

This study does not involve a medication. We are researching the use of neurostimulation, or very small electrical currents, on the back of the neck in patients with ASD and anxiety.
